## Min Cost Max Flow(DFS)

```
// Min-cost max-flow (uses DFS)
//
// Given a directed weighted graph, source, and sink, computes the minimum cost
// of the maximum flow from source to sink.
// This version uses DFS to find shortest paths and gives good performance on
// very "shallow" graphs: graphs which have very short paths between source
// and sink (e.g. at most 10 edges).
// In such cases this algorithm can be orders of magnitude faster than the
// Dijkstra version.
//
// To use, call init(n), then add edges using edge(x, y, c, w), and finally
// call run(src, sink).
//
// Functions:
// - init(n) initializes the algorithm with the given number of nodes
// - edge(x, y, c, w) adds an edge x->y with capacity c and weight w
// - run(src, sink) runs the algorithm and returns {total_cost, total_flow}
//
// Time complexity: O(V * E^3)

   }
}
```

## Z Algorithm

```
// Z Algorithm
//
// Given a string s of length N, computes an array z, where z[i] is the length
// of longest substring starting from index i which is also a prefix of s.
// More information: http://codeforces.com/blog/entry/3107
```

```
//
// Time complexity: O(N)

void z_algorithm(char *s, int N, int *z) {
  z[0] = N;
  int L = -1, R = -1;

  FOR(i, 1, N) {
    z[i] = i >= R ? 0 : min(R-i, z[i-L]);
    while (i+z[i] < N && s[i+z[i]] == s[z[i]]) ++z[i];
    if (i+z[i] > R) L = i, R = i+z[i];
  }
}
```

### Min rotation

```
// Lexicographically minimum rotation of a sequence
//
// Given a sequence s of length N, min_rotation(s, N) returns the start index
// of the lexicographically minimum rotation.
//
// Note: array s must be of length of at least 2 * N.
//
// Time complexity: O(N)

int min_rotation(int *s, int N) {
  REP(i, N) s[N+i] = s[i];

  int a = 0;
  REP(b, N) REP(i, N) {
    if (a+i == b || s[a+i] < s[b+i]) { b += max(0, i-1); break; }
    if (s[a+i] > s[b+i]) { a = b; break; }
  }
  return a;
}
```

### All palindrome

```
// Finds all palindromes in a string
//
// Given a string s of length N, finds all palindromes as its substrings.
//
// After calling manacher(s, N, rad), rad[x] will be the radius of the largest
// palindrome centered at index x / 2.
// Example:
// s = b a n a n a a
// rad = 0000102010010
//
// Note: Array rad must be of length at least twice the length of the string.
// Also, "invalid" characters are denoted by -1, therefore the string must not
// contain such characters.
//
// Time complexity: O(N)
//
// Constants to configure:
// - MAX is the maximum length of the string

void manacher(char *s, int N, int *rad) {
  static char t[2*MAX];
  int m = 2*N - 1;

  REP(i, m) t[i] = -1;
  REP(i, N) t[2*i] = s[i];

  int x = 0;
  FOR(i, 1, m) {
    int &r = rad[i] = 0;
    if (i <= x+rad[x]) r = min(rad[x+x-i], x+rad[x]-i);
    while (i-r-1 >= 0 && i+r+1 < m && t[i-r-1] == t[i+r+1]) ++r;
    if (i+r >= x+rad[x]) x = i;
  }

  REP(i, m) if (i-rad[i] == 0 || i+rad[i] == m-1) ++rad[i];
  REP(i, m) rad[i] /= 2;
}
```
